

EXPT NO:04

Perform IT Project Audit and generate a report using open-source tools

AIM:

To perform an IT project audit using open-source tools by examining project activities, identifying risks and issues, evaluating compliance and performance, and generating a comprehensive audit report.

ALGORITHM:

- Start the open-source IT project auditing tool.
- Create or import the IT project to be audited.
- Collect project information such as scope, schedule, resources, cost, and deliverables.
- Define the audit criteria and objectives.
- Examine project documentation, processes, and activities.
- Identify risks, issues, deviations, and compliance gaps.
- Evaluate project performance against the defined criteria.
- Record audit findings with their severity and recommendations.
- Generate the IT project audit report containing findings, risks, and corrective actions.
- Review and save the final audit report, then stop.

PROCEDURE:

- Open the selected **open-source** IT project auditing tool and create a new audit project.
- Enter the project details such as **project name, objectives, team, timeline, and deliverables**.
- Define the **audit scope, objectives, and evaluation criteria**.
- Import or enter relevant project documents, task details, schedules, and resource information.
- Review the project activities and compare the actual progress with the planned progress.
- Check the project for **risks, security issues, quality problems, cost deviations, and schedule delays**.
- Record each identified finding and assign an appropriate **severity level** such as Low, Medium, or High.
- Provide suitable recommendations and corrective actions for the identified issues.

- Generate the IT Project Audit Report containing project details, audit findings, risk levels, recommendations, and overall assessment.
- Review the generated report, save/export it, and verify that the audit results are complete and accurate.

OUTPUT:

The image displays two screenshots of the Mendix application interface, showing the progression from the homepage to a specific data entry page.

Top Screenshot: Mendix - Homepage

- Navigation Bar:** Home, risk, project, audit. Language: English, United States.
- Welcome to your homepage**
- 1 Define and organize your data**
 - Start by setting up your Domain Model, where you define the data structure for your app. This includes creating entities, attributes, and associations.
 - Domain model**
 - Diagram showing two entities: **YourEntity** (Attributes: Endpoint (String), AuditKey (String)) and **YourEntity2** (Attributes: UUID (String), Status (enumeration)). They are connected by an association labeled **YourEntity2>YourEntity**.
 - Text: "A well-structured Domain Model forms the foundation for the components and pages you'll build next."
 - [→ Learn more](#)
- 2 Add and connect widgets to your page**
 - localhost:8080/# your data in place, start building your page by dragging widgets from the toolbox onto the canvas. Connect them to your data to make your app interactive and dynamic.
- Feedback** button on the right side.
